

Product Proposal: CPAP Mobile Connect

Supply Renewal & AI-Integrated Support Ecosystem

Prepared by: Otto Willborn | ottowillborn@gmail.com | 778-554-7273

Prepared for: The CPAP Store

1. Executive Summary

This proposal outlines the transition from a web-only e-commerce model to a dedicated mobile application designed for high-frequency supply renewal. By integrating directly with the existing Shopify storefront and Gorgias support desk, the app minimizes development friction while maximizing customer retention through a streamlined interface, scheduled push notifications, and AI-driven chat automation.

2. Core E-Commerce Features

To effectively drive customer retention and increase lifetime value, these two features work in tandem to transform the "chore" of medical supply maintenance into a frictionless mobile experience.

One-Tap Replenishment

This feature leverages the **Shopify Storefront API** to bypass the traditional multi-step "browse and search" e-commerce flow. This is done using the users existing (or newly created on the app) Shopify account

- **Persistent Order History:** By securely linking the app to the user's Shopify account, the system identifies the exact SKU (e.g., a specific "Medium" nasal pillow mask) previously purchased by the customer.
- **Zero-Search Interface:** Rather than navigating a catalog of hundreds of devices, the user's home screen dynamically surfaces a "Ready to Reorder?" card featuring their exact setup.
- **Pre-filled Checkout:** The Shopify Storefront API allows the app to programmatically create a checkout object with the user's default shipping address and payment method already applied, enabling completion in under 30 seconds.
- **Real-time Availability:** The app performs a silent background check via the API to ensure the specific items are currently in stock before presenting the one-tap option to the user.

Automated Renewal Reminders

Since clinical guidelines generally recommend replacing CPAP masks and filters every 90 and 30 days respectively (standardized to a 2-month cycle for convenience), timing is critical.

- **Event-Based Triggers:** The 60-day countdown begins automatically once a purchase is marked as "Fulfilled" in the Shopify backend, rather than at the time of order.
- **Smart Deep-Linking:** The push notification is not a generic alert; it contains a deep link that takes the user directly to the pre-filled checkout screen for that specific item.
- **Educational Context:** To increase conversion, notifications can include a brief "Why it matters" note (e.g., "Bacteria buildup and mask leaks can reduce your therapy effectiveness") to reinforce the importance of the replacement.
- **Sync with Thrive:** For companies using Thrive for loyalty or memberships, these reminders can be cross-referenced to ensure users are utilizing any available subscription discounts or loyalty points during the renewal.

Conversion & Retention Analytics

To provide the business with clear ROI data, the app will include a dedicated analytics layer focusing on the transition from web to mobile performance:

- **Behavioral Tracking:** Monitoring "Time to Purchase" and "Cart Abandonment", specifically for the one-tap renewal flow.
- **Retention Heatmaps:** Visualizing how many users return every 60 days via push notifications vs. organic app opens.
- **A/B Testing Support:** Ability to test different notification copy (Educational vs. Direct) to see which drives higher renewal rates.

3. Support & AI Ecosystem (Gorgias Integration)

Native Gorgias Live Chat

The mobile app will implement the Gorgias Mobile SDK, allowing users to communicate with support agents without leaving the app. This will act in the same way as the live chat on the existing website. This ensures a unified ticket history between the web store and the mobile experience.

Grounded AI Assistant (Potential Implementation)

To scale support without increasing headcount, an AI layer would be integrated into the Gorgias workflow:

- **Document-Grounded Knowledge:** The AI will be trained on company-specific CPAP manuals, insurance FAQ, and machine troubleshooting guides to ensure accuracy.
- **Automated Self-Service:** The AI would resolve common queries (tracking, machine setup, leaks) before a ticket reaches a human.
- **Order Status Checks:** Since the Gorgias AI would be connected to Shopify, it would have the ability to easily handle common order status questions.
- **Agent Handover:** High-complexity medical or prescription issues are instantly escalated to a live Gorgias agent.

4. Technical Implementation

Frontend: React Native / Flutter (Multi-platform iOS & Android)

Backend Logic: Shopify Storefront API & Gorgias HTTP Request API

AI Layer: RAG-based LLM (Gemini/OpenAI) using a private company knowledge base

5. Development Timeline

Phase	Focus	Duration
Phase 1	Requirements gathering& clarification, user story collection & existing infrastructure	3-6 Weeks
Phase 2	Shopify Integration & Catalog Sync	6 Weeks
Phase 3	Gorgias SDK & Live Chat Setup	4 Weeks
Phase 4	AI Grounding & Knowledge Training	5 Weeks
Phase 5	QA & App Store Launch	4 Weeks

Project Summary

Total Timeline: ~25 Weeks

Labor Budget: \$60,000 – \$80,000

Assumptions

The above was based on the following assumptions:

- Shopify (or other API) handles user login and authentication.
- Client is in possession of structured manuals/FAQs for model training.
- Shopify handles any legal or insurance risks with payment.
- Gorgias is used for customer-helpdesk communication through its chat interface.
- All platform fees (Apple/Google/AI tokens) are covered by the client.
- This application would not replace the existing webapp and only be used on IOS and Android.
